## Week 1 Discussion (Auxiliary Notes)

## 1. Review: Polynomials, Exponentials, Logarithms, and their Derivatives

a. Polynomials

$$p(n) = \sum_{i=0}^{d} a_i n^i$$
 is called a polynomial in n of degree d where  $a_d \neq 0$ .

A polynomial is asymptotically positive if and only if  $a_d > 0$ , and we have  $p(n) = \Theta(n^d)$ .

b. Exponentials

 $a^n$  is the basic form of an exponential, where a is called base.

$$(a^n)^m = a^{mn} = (a^m)^n.$$

For all real constants a and b such that a > 1,

$$\lim_{x \to \infty} \frac{n^b}{a^n} = 0$$

from which we can conclude that any exponential function with a base strictly greater than 1 grows faster than any polynomial function.

c. Logarithms

$$\lg n = \log_2 n$$
;  $\ln n = \log_e n$  (natural logarithm).

For all real a > 0, b > 0, c > 0, and n, we have the following properties:

i. 
$$a = b^{\log_b a}$$

ii. 
$$\log_c(ab) = \log_c a + \log_c b$$

iii. 
$$\log_b a^n = n \log_b a$$

iv. 
$$\log_b a = \frac{\log_c a}{\log_c b}$$

d. Derivatives

$$f(x) = ax^n, \frac{\mathrm{d}f}{\mathrm{d}x} = anx^{n-1}.$$

$$f(x) = a^x$$
,  $\frac{\mathrm{d}f}{\mathrm{d}x} = a^x \ln a$ .

$$f(x) = \ln x, \frac{df}{dx} = \frac{1}{x}, x > 0; f(x) = \log_a x, \frac{df}{dx} = \frac{1}{x \ln a}, x > 0.$$

2. Asymptotic Notation:  $O, \Omega, \Theta$ 

**Example**: We have  $f(n) = \lg n$ ,  $g(n) = \ln n$ , what is their relation represented in asymptotic notation? There are two ways.

a. By definition

b. By using limits (L'Hopital's rule)
